5 # IHE IT Infrastructure
Technical Framework Supplement

10 # Mobile Alert Communication Management (mACM)

HL7® FHIR® STU 3
Using Resources at FMM Level 2

15 # Rev. 2.3 – Trial Implementation

20 Date: July 24, 2018
Author: IHE ITI Technical Committee
Email: iti@ihe.net

25 **Please verify you have the most recent version of this document.** See here for Trial Implementation and Final Text versions and here for Public Comment versions.

Foreword

This is a supplement to the IHE IT Infrastructure Technical Framework V15.0. Each supplement undergoes a process of public comment and trial implementation before being incorporated into the volumes of the Technical Frameworks.

This supplement is published on July 24, 2018 for trial implementation and may be available for testing at subsequent IHE Connectathons. The supplement may be amended based on the results of testing. Following successful testing it will be incorporated into the IT Infrastructure Technical Framework. Comments are invited and may be submitted at http://www.ihe.net/ITI_Public_Comments.

This supplement describes changes to the existing technical framework documents.

"Boxed" instructions like the sample below indicate to the Volume Editor how to integrate the relevant section(s) into the relevant Technical Framework volume.

Amend Section X.X by the following:

Where the amendment adds text, make the added text **<u>bold underline</u>**. Where the amendment removes text, make the removed text **~~bold strikethrough~~**. When entire new sections are added, introduce with editor's instructions to "add new text" or similar, which for readability are not bolded or underlined.

General information about IHE can be found at http://ihe.net.

Information about the IHE IT Infrastructure domain can be found at http://ihe.net/IHE_Domains.

Information about the organization of IHE Technical Frameworks and Supplements and the process used to create them can be found at http://ihe.net/IHE_Process and http://ihe.net/Profiles.

The current version of the IHE IT Infrastructure Technical Framework can be found at http://ihe.net/Technical_Frameworks.

55 **CONTENTS**

130

Introduction to this Supplement

Whenever possible, IHE profiles are based on established and stable underlying standards. However, if an IHE committee determines that an emerging standard offers significant benefits for the use cases it is attempting to address and has a high likelihood of industry adoption, it may develop IHE profiles and related specifications based on such a standard.

The IHE committee will take care to update and republish the IHE profile in question as the underlying standard evolves. Updates to the profile or its underlying standards may necessitate changes to product implementations and site deployments in order for them to remain interoperable and conformant with the profile in question.

This mACM Profile uses the emerging HL7[1] FHIR[2] specification. The FHIR release profiled in this supplement is STU 3. HL7 describes the STU (Standard for Trial Use) standardization state at https://www.hl7.org/fhir/versions.html.

In addition, HL7 provides a rating of the maturity of FHIR content based on the FHIR Maturity Model (FMM): level 0 (draft) through 5 (normative ballot ready).The FHIR Maturity Model is described at http://hl7.org/fhir/versions.html#maturity.

Key FHIR STU 3 content, such as Resources or ValueSets, used in this profile, and their FMM levels are:

FHIR Resource Name	FMM Level
Communication	2
CommunicationRequest	2

135   The mACM Profile provides the infrastructural components needed to send short, unstructured text alerts to human recipients and can record the outcomes of any human interactions upon

---

[2] FHIR is the registered trademark of Health Level Seven International.

receipt of the alert. The mACM Profile additionally allows for a feedback mechanism to determine the status of an alert through the use of alert statuses.

Open Issues and Questions

140 *#6) MEMLS has location notion of physical offset (e.g., within building). How should this be represented for the dissemination event location field? See Appendix A of PCD MEM-LS Supplement.*

*#11) Open Issue: mACM definition of "alert" is not same as general definition: http://ihe.net/uploadedFiles/Documents/Templates/IHE_TF_GenIntro_AppD_Glossary_Rev1.0_*
145 *2014-07-01.pdf*

It is not clear how to resolve: For example, PCD's term could be broadened or we could rewrite this profile to not use the term alert.

#19) Opened CPs with FHIR (10390 and 10391) to enable searching on CommunicationRequest.reason and Communication.reason.

150 *#21) In Table 3.84.5.2-3: Alert Status Value Set Mapping there are many values from PCD that are combined into one value from FHIR. We will open a CP to add failed, but are there others that should be requested and is this a problem? The CommunicationRequest and Communication statuses are more directly related to that particular communication and request and not really of the alert itself. Responses would be handled as a second Communication resource. notDone and*
155 *notDoneReason can also be used to track the reason one Communication failed or wasn't sent. Does there need to be a field in CommunicationRequest to track the current alert status? Is there a better mapping of these values in the table?*

Closed Issues

#0) Should a codeset be defined to capture the priority of an alert in the flag.priority resource. .

160 *#1) Would we be prescriptive about the way to set PCD abnormality flags in the flag.characteristics data field? Table 8.3 is referenced, but no uri or oid is specified.*

#2) mACM defines FHIR extensions which require profiles in 3.84.41.2.1and 3.85.41.2.1. FHIR requires that these profiles are published. Currently the text states that the profiles are available at, for example:

165 *http://www.ihe.net/fake_url_for_trial_implementation/mACM/Profile/flag.recipient*

these URLs are examples only. Upon publication, a permanent home for any needed extension points should be defined as an IHE resource.

We have removed all extensions and just have constraints.

#3) Do not have a way to identity a device which is a non-medical device (e.g., not subject to
170 *FDA regulation) A clarification issue on FHIR was raised:*

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=6209&start=0

#4) Should we have Device as a recipient in transactions 84 and 85. This is not specifically required for the uses cases described in Vol 1, but may be useful for PCD.

175 *#5) For the flag.author data field, it would be useful to have the author of an alert be an Organization resource (e.g., CDC). A FHIR issue was filed:*

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=6208&start=0

If this Issue is not approved, an extension point should be added to the flag resource to allow an
180 *Organizational author of the alert. For example, the following could be added to Table 3.84.4.2.2.1-1:*

`extension [0..1]`	This data field identifies the originator of the alert. This data field is defined as an extension with URL `flag.author` and with value in `valueReference` and whose value is an organization represented by a reference to an `Organization` resource. This data field should only be populated if a subject of care was not identified.	`Reference( Organization )`

#7) The use of the flag.category is unclear – it could either be flag/alert content or could be used
185 *for alert filtering/routing. A FHIR issue was filed:*

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=6170&start=0

to clarify its use. A FHIR Skype conversation indicated that the later sense of flag.category is what is intended, and this is the way that is used in this profile.

190 *#8) Use Case #1 in Vol 1 requires that an alert be issued without an identified subject of care. The flag resource has a flag.patient field that is [1..1] which would preclude the use of the flag resource for this use case. A FHIR issue has been filed:*

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=6171&start=0

195 *to change to [0..1]. If this CP is approved, then Section 3.84.4.1.2.1 should be updated.*

#9) A concern brought up by PCD is that the use of flag.patient is limiting scope of the alert. What about location or equipment source=medical device, a use cased highlighted in Vol 1 of PCD? Example of a location would be a cord pull in bathroom in a hallway. A FHIR issue was raised:

200 http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=6271&start=0

CP was rejected by FHIR and not relevant now because we're using the Communication resource.

#10) Multiple extension points have been define by this profile on the FHIR flag resource. Some
of those may be useful to be part of the core resource. A FHIR issue to this effect was raised
here:

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=6272&start=0

Extension points have been removed.

#12) The PCD referenced WCTP standard is not a formally published standard and that
maintenance of WCTP is within the PCD Technical Committee.

#13) Would be good to have Group as an allowed recipient for an alert. FHIR issue filed:

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=8466

This was accepted, but it looks like it should also be added to CommunicationRequest resources:

http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=9773

These have both been approved.

#14) Would be useful to have Period in the core Communication resource rather than as an
extension
http://gforge.hl7.org/gf/project/fhir/tracker/?action=TrackerItemEdit&tracker_item_id=8467

This was rejected by FHIR: "Communication represents a piece of information that *was*
conveyed to a recipient. Validity period isn't relevant. (Flag on the other hand represents a piece
of data that should be continuously exposed to a category of recipients over a period of time.)"

This raises the issue of whether mACM should use CommunicationRequest resources as the
trigger.

We have decided to use CommunicationRequest as the primary FHIR Resource for sending alerts.

#15) Figure 3.84.4.1.3.1-1 probably should live in Volume 1.

We decided against this.

#16) Should there be a FHIR CP for other extensions? This will depend on open issue #14
resolution.

There are currently no extensions, just constraints so this is no longer necessary.

#17) Should the dissemination extension be replaced by multiple Communication resources
sharing the same original CommunicationRequest resource?

We have made this change.

235 *#18) FHIR CP #10387 asks for a way to describe the location a CommunicationRequest refers to. The current Table 3.85.4.2-1 uses sender.location (when sender is a Device). Is sender.location suitable?*

This CP wanted more reason which we didn't have. We have left it using the Device.location when the sender is a device.

240 *#20) Should the basedOn field be constrained to only allow a maximum of one entry that must be the CommunicationRequest that started the process. This should meet the needs of this profile since the Communication is only created by the server and isn't created from any other outside means.*

We decided to constrain this for this profile as that is what is required. Communications created
245 by this profile shouldn't have other needs, but we can take another look if it is needed to include multiples.

#22) Should Table 3.84.5.21-52: Mobile Report Alert Priority Code System have a different mapping, there aren't the same number as in FHIR: routine, urgent, asap, stat.

We made a mapping of the 4 values even though they didn't seem to exactly match in context.

250

General Introduction

Update the following Appendices to the General Introduction as indicated below. Note that these are not appendices to Volume 1.

255 ## Appendix A – Actor Summary Definitions

Add the following actors to the IHE Technical Frameworks General Introduction list of actors:

Actor	Definition
Alert Reporter	This actor originates the alert (an alarm, either physiological or technical, or an advisory). May also query the Alert Aggregator for the status of the alert.
Alert Aggregator	This actor receives alerts from an Alert Reporter and collects status events related to the dissemination of the alert.
Alert Manager	This actor receives alerts from an Alert Reporter, manages them according to business context, and disseminates them to an Alert Communicator.

Note: The Alert Communicator is defined in PCD TF-1: 6.3.4 of the IHE Patient Care Device (PCD) Technical Framework
(http://www.ihe.net/uploadedFiles/Documents/PCD/IHE_PCD_TF_Vol1.pdf).

260

Appendix B – Transaction Summary Definitions

Add the following transactions to the IHE Technical Frameworks General Introduction list of Transactions:

Transaction	Definition
Mobile Report Alert [ITI-84]	This transaction is used by the Alert Reporter to report alerts to the Alert Aggregator. The Alert Reporter sends alerts to the Alert Aggregator in an unsolicited manner.
Query for Alert Status [ITI-85]	This transaction is used by the Alert Reporter to query an Alert Aggregator for alert status information as communicated to an Alert Aggregator for a particular alert.

265 # Glossary

Add the following glossary terms to the IHE Technical Frameworks General Introduction Glossary:

No new glossary terms.

42 Mobile Alert Communication Management (mACM) Profile

The mACM Profile provides the infrastructural components needed to send short, unstructured text alerts to human recipients and can record the outcomes of any human interactions upon receipt of the alert. The mACM Profile additionally allows for a feedback mechanism to determine the status of an alert through the use of alert statuses. Additional characteristics of alerts are discussed in Section 42.1.4.1.

Recognizing that there are many health care workflows that could leverage a notification mechanism, it is not the aim of this profile to describe all of these workflows. Instead, this profile will limit considerations to two use cases:

- *Crisis Response,* defined in Section 42.4.2.1, covers the distribution of notifications to health workers defined by the Common Alerting Protocol version 1.2.

- *Care Reminders,* defined in Section 42.4.2.2, covers the distribution of notifications to care givers and subjects of care based on upcoming or missed appointments as defined, medication reminders and other similar patient care reminders.

It is the expectation that the infrastructural components of the mACM Profile will be reusable beyond the use cases described in Section 42.4.2 and will support extensions to support domain specific workflows.

The mACM Profile:

- defines a transaction, Mobile Report Alert [ITI-84], which is suitable for mobile devices and non-clinical contexts and provides alternative message semantics for the Report Alert [PCD-04] transaction;

- defines a transaction, Query for Alert Status [ITI-85], which allows an originator of an alert to receive all status updates on alert that it reported;

- supports alerting in national deployment and cross-enterprise contexts in addition to a controlled health delivery network;

- supports interaction with the public, such as appointment reminders, on a broad a variety of devices, interaction timings and platforms.

42.1 Mobile Alert Communication Management (mACM) Actors, Transactions, and Content Modules

Figure 42.1-1 shows the actors directly involved in the mACM Profile and the relevant transactions between them.

No content modules are defined by the mACM Profile.
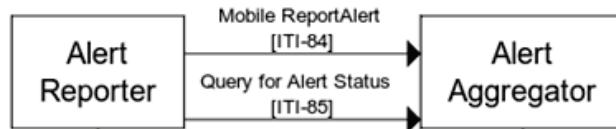

Figure 42.1-1: mACM Actor and Transaction Diagram

310 Table 42.1-1 lists the transactions for each actor directly involved in the mACM Profile. To claim compliance with this profile, an actor shall support all required transactions (labeled "R") and may support the optional transactions (labeled "O").

Table 42.1-1: mACM Profile - Actors and Transactions

Actors	Transactions	Optionality	Reference
Alert Reporter	Mobile Report Alert [ITI-84]	R	ITI TF-2c: 3.84
	Query for Alert Status [ITI-85]	O	ITI TF-2c: 3.85
Alert Aggregator	Mobile Report Alert [ITI-84]	R	ITI TF-2c: 3.84
	Query for Alert Status [ITI-85]	R	ITI TF-2c: 3.85

42.1.1 Actor Descriptions and Actor Profile Requirements

315

Most requirements are documented in the Volume 2 Transactions and the Volume 3 Content Modules. This section documents any additional requirements on profile actors.

42.1.1.1 Alert Reporter

An Alert Reporter shall originate or relay alerts (an alarm, either physiological or technical, or an 320 advisory) to the Alert Aggregator using the Mobile Report Alert [ITI-84] transaction.

Under the Query for Alert Status Option, this actor can query an Alert Aggregator for details related to the dissemination of this alert to the intended recipient(s).

The Alert Reporter may receive alerts from multiple sources and translate these alerts as needed to make them interoperable with the Alert Aggregator. It does not need to be the original source 325 of the alert data. The means by which an Alert Reporter may receive alerts from other sources is out of scope of this profile.

The Response message of the Mobile Report Alert [ITI-84] and Query for Alert Status [ITI-85] transactions may additionally reference Fast Healthcare Interoperability Resources (FHIR®[3]). An

---

[3] Fast Healthcare Interoperability Resources and FHIR are the registered trademarks of Health Level Seven.

Alert Aggregator's response in these transactions may include URL references to FHIR
330   Resources. Such referenced resources could include, but are not limited to `Practitioner`, `Patient`, `Group`, `Organization`, `Device` and `Location`. In such an instance, an Alert Reporter may need to resolve the URL reference to obtain any needed data. See ITI TF-2x: Appendix Z.5 for details.

42.1.1.2 Alert Aggregator

335   The Alert Aggregator receives alerts from the Alert Reporter via the Mobile Report Alert [ITI-84] transaction. The Alert Aggregator uses recipient information from the alert reporter to determine the contact information for that recipient. The Alert Aggregator may then manage these alerts according to the required jurisdiction-defined business context, for example dispatching them onto a communications platform for delivery to an intended recipient.

340   The Alert Aggregator may optionally collect details related to the dissemination of the alert, for example under the Disseminate and Report Alert Status Option. The Alert Aggregator makes queries against these dissemination details available via the Query for Alert Status [ITI-85] transaction.

The Response message of the Mobile Report Alert [ITI-84] and Query for Alert Status [ITI-85]
345   transactions may utilize FHIR Resources.

When the Alert Aggregator includes a reference, the Alert Aggregator ensures that the reference resolves to the intended FHIR Resource. Such referenced resources could include, but are not limited to `Practitioner`, `Patient`, `Group`, `Organization`, `Device` and `Location`.

42.2 mACM Actor Options

350   Options that may be selected for each actor in this profile, if any, are listed in the Table 42.2-1. Dependencies between options when applicable are specified in notes.

Table 42.2-1: mACM - Actors and Options

Actor	Option Name	Reference
Alert Reporter	Query for Alert Status	Section 42.2.1
Alert Aggregator	Disseminate and Report Alert Status	Section 42.2.2

42.2.1 Query for Alert Status Option

The Query for Alert Status Option enables an Alert Reporter to retrieve feedback on the current
355   status of the alert. This option supports analytics on the delivery status and provides feedback capabilities for other business processes that an Alert Reporter implements.

An Alert Aggregator may collect and make available for querying the information related to the dissemination of an alert, either through the Disseminate and Report Alert Status Option, or through other means, which are out of scope of this profile.

360　An Alert Reporter that supports the Query for Alert Status Option shall initiate the Query for
Alert Status [ITI-85] transaction.

42.2.2 Disseminate and Report Alert Status Option

This option enables mACM actors to operate in an environment that is also using the IHE PCD
ACM Profile.

365　An Alert Aggregator that claims the Disseminate and Report Alert Status Option shall be
grouped with an ACM Alert Manager. This grouping enables the mACM Alert Aggregator to
collect feedback on the current status of an alert disseminated in an ACM environment.

- When the mACM Alert Aggregator receives a valid Mobile Report Alert [ITI-84]
  transaction, the grouped ACM Alert Manager initiates the Disseminate Alert [PCD-06]
370　 transaction to an ACM Alert Communicator, using the translation tables in ITI TF-2c:
  3.84.5.2

- When the ACM Alert Manager receives a response to Report Dissemination Alert Status
  [PCD-07] about the corresponding alert, then the grouped mACM Alert Aggregator shall
  represent the dissemination data in a Query for Alert Status [ITI-85] response, using the
375　 translation tables in ITI TF-2c: 3.84.5.2.

See ITI TF-2c: Figure 3.84.4.1.3.2-2 and ITI TF-2c: 3.84.4.1.3.2 "Expected Actions -
Disseminate and Report Alert Status Option".

42.3 mACM Required Actor Groupings

An actor from this profile (Column 1) shall implement all of the required transactions and/or
380　content modules in this profile *in addition to* all of the transactions required for the grouped
actor (Column 2).

Table 42.3-1: mACM - Required Actor Groupings

mACM Actor	Actor to be grouped with	Reference	Content Bindings Reference
Alert Aggregator with the Disseminate Status and Report Alert Option	PCD ACM Alert Manager	PCD TF-1: 6.1	--
Alert Reporter	None		

42.4 mACM Overview

385　The mACM Profile supports the delivery of a variety of alerts to both Health Workers and
Clients (Subjects of Care) with a feedback mechanism to record delivery status and human
responses.

42.4.1 Concepts

In Figure 42.4.1-1, the sequencing of the transactions in Figure 42.1-1 is illustrated.
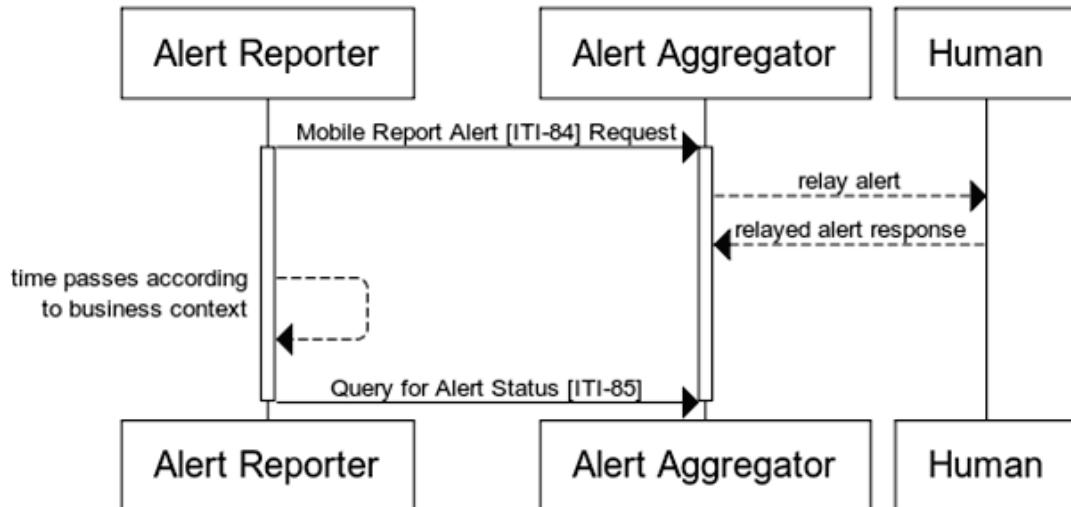

390

Figure 42.4-1: Process Flow Diagram

The text in Figure 42.4-2 was used to generate the diagram in Figure 42.4-1. Readers will
generally find the diagram more informative. The text is included here to facilitate editing.

410

Figure 42.4-2: Pseudocode for Process Flow Diagram

42.4.2 Use Cases

415

The mACM Profile takes into consideration uses cases that span clinical, health systems
management and public health domains.

420 A critical requirement of the mACM Profile is the ability to provide basic alerting services within resource-constrained environments with a low barrier to entry. Such communities may exist at national context for Low and Middle Income Countries (LMICs[4]), as well as underserved communities in high-income countries (e.g., the population targeted by Detroit's Beacon Project[5]). A proliferation of alerting services exists in national health networks of resource-constrained countries (see Figure 42.4.2-1 for an illustrative example) and the mACM Profile fulfills an important need of the ministries of health to provide a central messaging

425 infrastructure. Such a centralized infrastructure provides the ministry the ability to:

- Assert and enforce governance policies on the utilization of alerting services on mobile platforms

- Define and enforce cost control measures across various mobile alerting platforms

[4] http://data.worldbank.org/about/country-and-lending-groups

[5] http://www.healthit.gov/sites/default/files/beacon-factsheet-semi.pdf
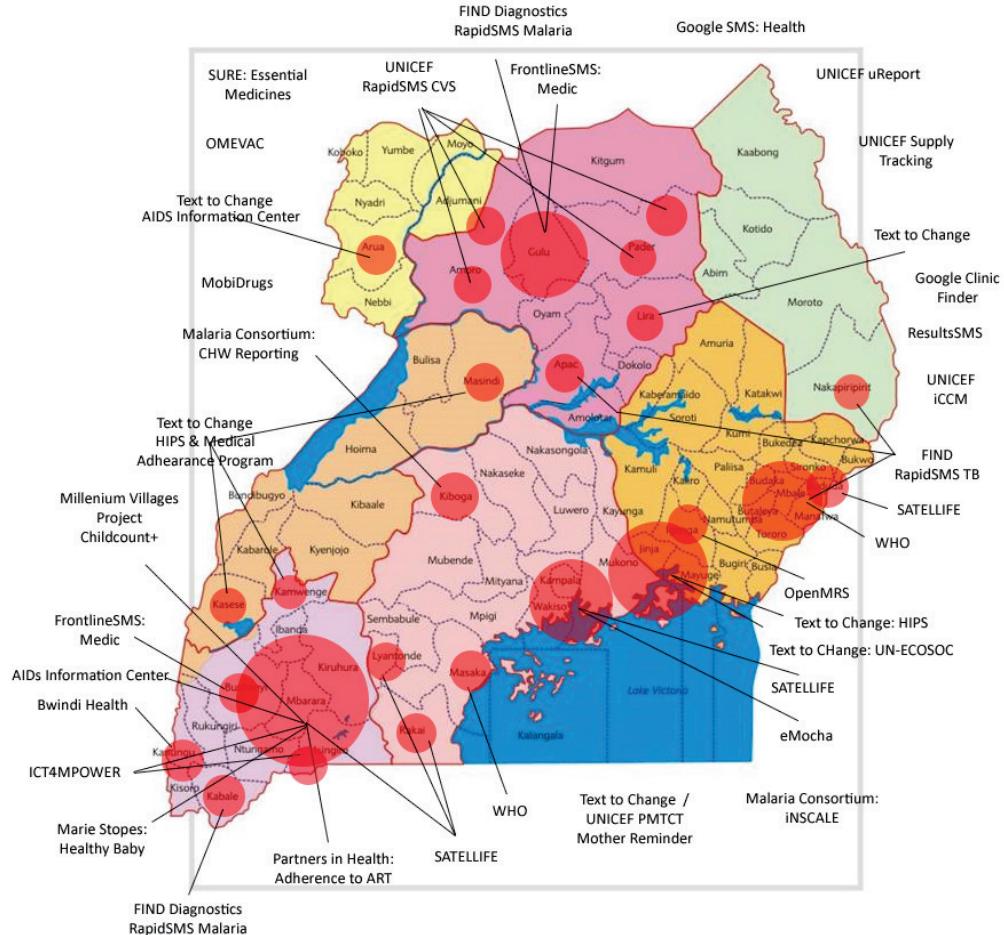

Figure 42.4.2-1 Extant mobile-based mHealth Services in Uganda

42.4.2.1 Use Case #1: Crisis Response

In response to a crisis or emergency situation, such as the 2014 and 2015 outbreaks of Ebola in western Africa, it is critical to communicate to health workers across organizational and national boundaries, and to verify receipt of such alerts. Such alerts are commonly issued in the OASIS Common Alerting Protocol (CAP) format:

- http://docs.oasis-open.org/emergency/cap/v1.2/CAP-v1.2-os.html

There is a desire to assure human acknowledgment of receipt of these CAP messages.

42.4.2.1.1 Crisis Response Use Case Description

440 The Crisis Response use case describes the mechanism for delivering alerts in the CAP format to health workers within a particular health care network. The nature of this network is not prescribed in this profile and may consist, for example, of a network of hospitals or a national health care network.

The manner of production and publication of the CAP message is not prescribed in this profile.

445 There are several existing profiles and specifications related to CAP messages that detail values of and requirements on particular data fields. Such specifications include:

- OASIS Integrated Public Alert and Warning System (IPAWS)
- HITSP T 63 - Emergency Message Distribution Element Transaction
- NIEM Emergency Management

450 This profile can be used to relay CAP messages issued by an appropriate authority to an appropriate set of health workers on last-mile devices. In addition, this profile describes a mechanism for recording human acknowledgment of receipt of information contained in the CAP messages. These responses can it turn be used for analytical and monitoring purposes.[6]

42.4.2.1.2 Crisis Response Process Flow

455 The workflow for delivery and acknowledgment of a CAP message is illustrated in Figure 42.4.2.1.2-1.

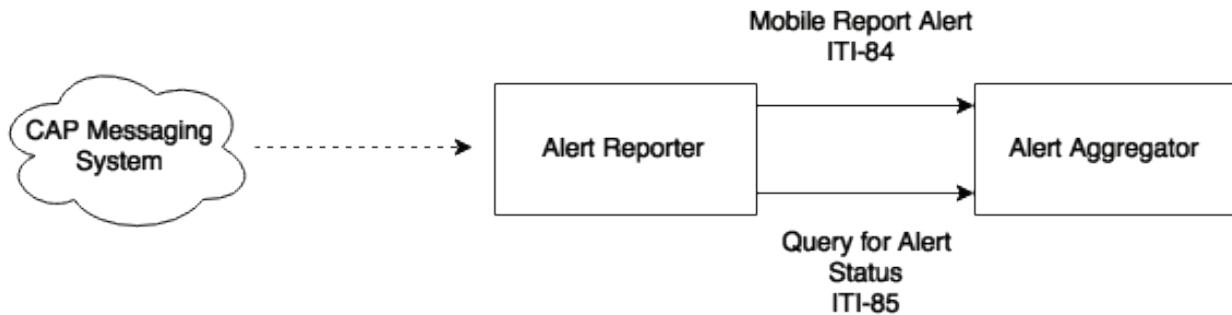

Figure 42.4.2.1.2-1: CAP Delivery and Acknowledge

---

[6] Waidyanatha, Nuwan and Gow, Gordon and Anderson, Peter, Common Alerting Protocol Message Broker for Last-Mile Hazard Warning System in Sri Lanka: An Essential Component (May 2007). Available at SSRN: http://ssrn.com/abstract=1568001 or http://dx.doi.org/10.2139/ssrn.1568001

Figure 42.4.2.1.2-1 illustrates the distribution of a CAP message from an external system to an Alert Reporter. Though the method for receiving a CAP message is not specified by the profile, the Alert Reporter should:

- Identify a cohort of health workers for receiving the text of the CAP message

- Translate the CAP message into the message semantics defined in ITI TF-2c: 3.84 and transmit to the Alert Aggregator

The Alert Aggregator distributes the alert and collects alert dissemination statuses from Alert Communicators and makes status information available to the Alert Reporter via the Query for Alert Status.

42.4.2.2 Use Case #2: Care Reminders

A subject of care may receive care from multiple providers across multiple health care networks, and coordination of care across providers and networks is difficult. If an Electronic Medical Record or Longitudinal/Shared Health Record is present, Care Reminder alerts can be triggered through the examination of clinical records about the subject of care. Care Reminder alerts are sent either to the subject of care or a designated health worker.

42.4.2.2.1 Care Reminder Use Case Description

The following are illustrative examples of Care Reminder alerts:

- (Rwanda) When patients are referred to the district hospital by a Community Health Worker (CHW), the CHW can choose an immediate, urgent or routine referral. In urgent cases, they must visit the hospital within three days and for routine referrals, they must visit the hospital within seven days. The Health Information Exchange (HIE) is able to detect if the patient has missed her referral by checking if an encounter has been received at the Longitudinal Health Record within the time frame. If an encounter has not been received the HIE sends out an out an alert of the missed appointment to inform the CHW that originally interfaced with that patient.

- (Tanzania) An examination of an Electronic Medical or Health Record indicates that a child has missed a vaccination according to an established protocol of care. An SMS reminder is generated and sent to the mother or other designated guardian. In the case when a mother does not have access to a cell phone or other electronic device, an alert should be generated and sent to the child's caregiver. This caregiver could be a Community Health Worker, a village elder, or a sub-village chairman.

490 **42.4.2.2.2 Care Reminder Process Flow**
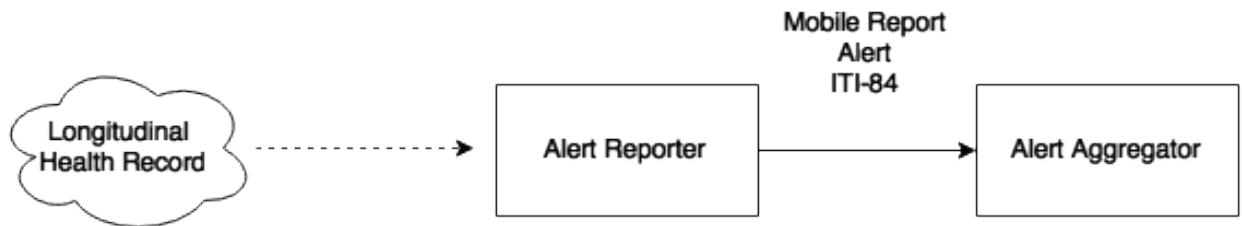

Figure 42.4.2.2-1: Care Reminders

42.5 mACM Security Considerations

The implementer of this profile is advised that many risks cannot be mitigated by the IHE profile
495 and instead the responsibility for mitigation is transferred to the vendor, and occasionally to the
operational environment.

To address identified security risks for the transactions defined in this profile, implementers
should ensure that:

- All actors in mACM are grouped with a Consistent Time (CT) Profile - Time Client. This
500 grouping will assure that all systems have a consistent time clock to assure a consistent
timestamp for audit logging and alert dissemination.

- All actors in mACM are grouped with an Audit Trail and Node Authentication (ATNA)
Profile - Secure Node or Secure Application Actor. This grouping will assure that only
highly trusted systems can communicate and that all changes are recorded in the audit
505 log.

- The Alert Reporter is grouped with an Authorization Client in the Internet User
Authorization (IUA) Profile. The Alert Aggregator should be grouped with an IUA
Resource Server. This grouping will enable service side access control and more detailed
audit logging if ATNA is also used.

510 - All actors in mACM are grouped with the appropriate actor from the Enterprise User
Authentication (EUA) Profile to enable single sign-on inside an enterprise by facilitating
one name per user for participating devices and software.

In particular, appropriate care should be taken when a subject of care is identified in the alert as
the content may contain PHI. There are many security and privacy concerns with mobile devices,
515 including lack of physical control. Many common information technology uses of HTTP,
including REST, are accessing far less sensitive information than health documents. These
factors present an especially difficult challenge for the security model. It is recommended that
application developers perform a Risk Assessment in the design of the applications, and that
operational environment using mACM perform Risk Assessments in the design and deployment
520 of the operational environment.

An Alert Aggregator should not return any patient information in transaction Mobile Report Alert [ITI-84] or Query for Alert Status [ITI-85] unless proper authentication and communications security have been proven.

There are many reasonable methods of securing transactions. These security models can be layered in at the HTTP transport layer and do not modify the interoperability characteristics defined in the mACM Profile.

42.5.1 Patient Safety Considerations

If used beyond original use cases, patient safety risks may need to be assessed.

42.6 mACM Cross Profile Considerations

42.6.1 Health Worker Registry Services

The Alert Reporter would receive great benefit from operating in a health care network that has a registry of health worker. These registries can be used to create a list of enterprise IDs for health workers. Such a service for health workers could be provided, for example, by the:

- Care Services InfoManager in the Care Services Discovery (CSD) Profile
- Provider Information Directory in the Healthcare Provider Directory (HPD) Profile
- Personnel White Pages Directory in the Personnel White Pages (PWP) Profile

The utility of such providing such services is illustrated in Figure 42.6.1-1, which shows in interaction diagram, and Figure 42.6.1-2, which shows a sequencing of these interactions.
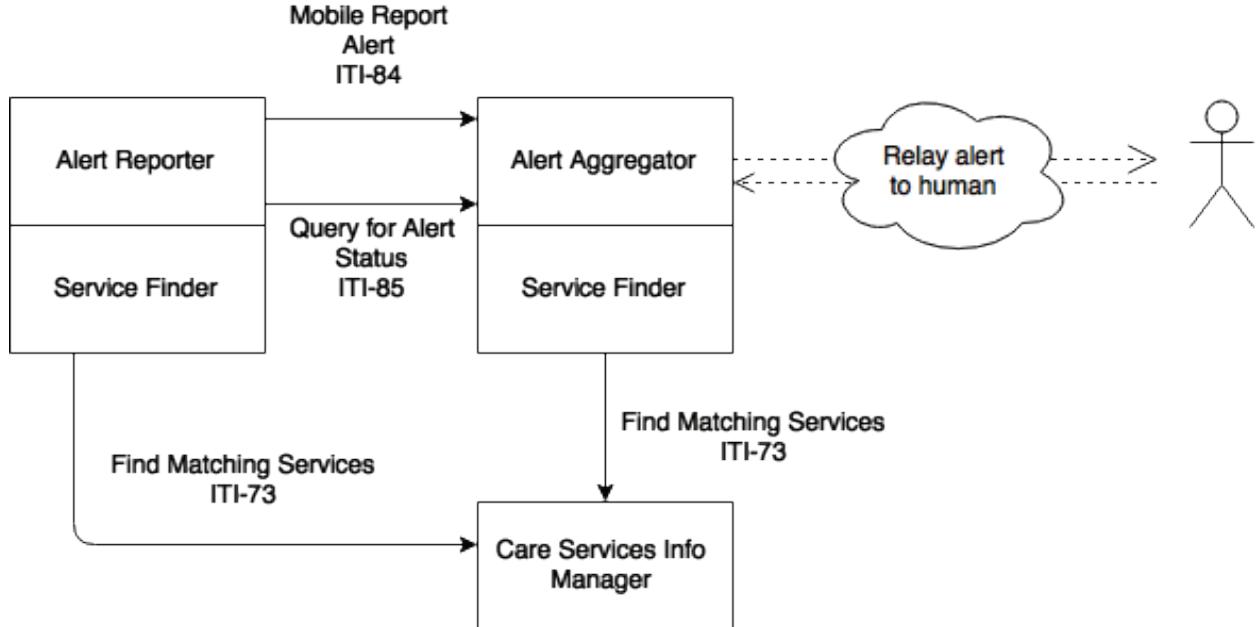

540

Figure 42.6.1-1: mACM Actor Interactions with a Health Worker Registry

In Figure 42.6.1-1, the CSD InfoManager acts as a registry of health workers in the health
system. The Alert Reporter, grouped with a Service Finder, executes an appropriate Find
Matching Services [ITI-73] transaction to determine a list of enterprise IDs for targeted health
545   workers according to internal business requirements. The Alert Reporter then sends the alert on
to the Alert Aggregator using the Mobile Report Alert [ITI-84] transaction. The Alert
Aggregator, grouped with a Service Finder, may also execute an appropriate Find Matching
Services [ITI-73] transaction in order to determine the contact points (e.g., cell phone number) of
the referenced health worker.

550
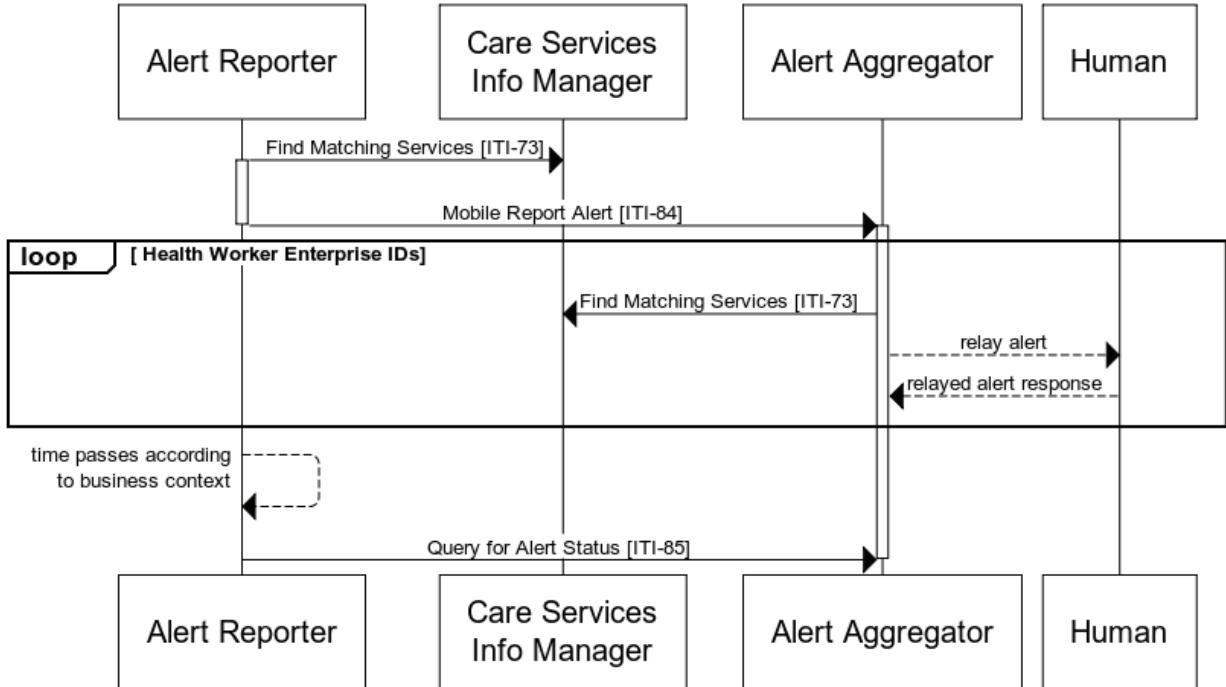

Figure 42.6.1-2: Sequencing of mACM Actor Interactions with a Health Worker Registry

The text in Figure 42.6.2.1-3 was used to generate the diagram in Figure 42.6.2.1-2. Readers will generally find the diagram more informative. The text is included here to facilitate editing.

570

575

**Figure 42.6.1-3: Pseudocode for Sequencing of mACM Actor Interactions
with a Health Worker Registry**

In Figure 42.6.1-2, a potential sequencing of the transactions in Figure 42.6.1-1 is illustrated. These steps may be described as follows:

580
1. The Alert Reporter, grouped with a Care Services Finder, executes the Find Matching Services [ITI-73] transaction against a Care Services InfoManager to determine the enterprise IDs for a list of Health Workers matching a set of criteria. The specific criteria used are dependent on the business context under which the alert is intended to be communicated.

585
2. Using the resultant list of Health Worker enterprise IDs, the Alert Report executes Mobile Report Alert [ITI-84] to report the given alert to an Alert Aggregator.

3. For each Health Worker identified in the alert, the Alert Aggregator, grouped with a Service Finder, determines available contact points (e.g., telephone number, email address) by executing Find Matching Services [ITI-73] against a Care Services
590
InfoManager.

42.6.2 Client Registry Services

The Alert Reporter would receive great benefit from operating in a health care network that has a health client registry. These registries can be used to create a list of enterprise IDs for subjects of care. Such a service for a client registry could be provided, for example, by the:

595
- The Patient Demographics Supplier in the Patient Demographics Query (PDQ) Profile

- The Patient Demographics Supplier in the Patient Demographics Query for Mobile (PDQm) Profile

The utility of such providing such services is illustrated in Figure 42.6.2-1, which shows in interaction diagram, and Figure 42.6.2-2, which shows a sequencing of these interactions.

600
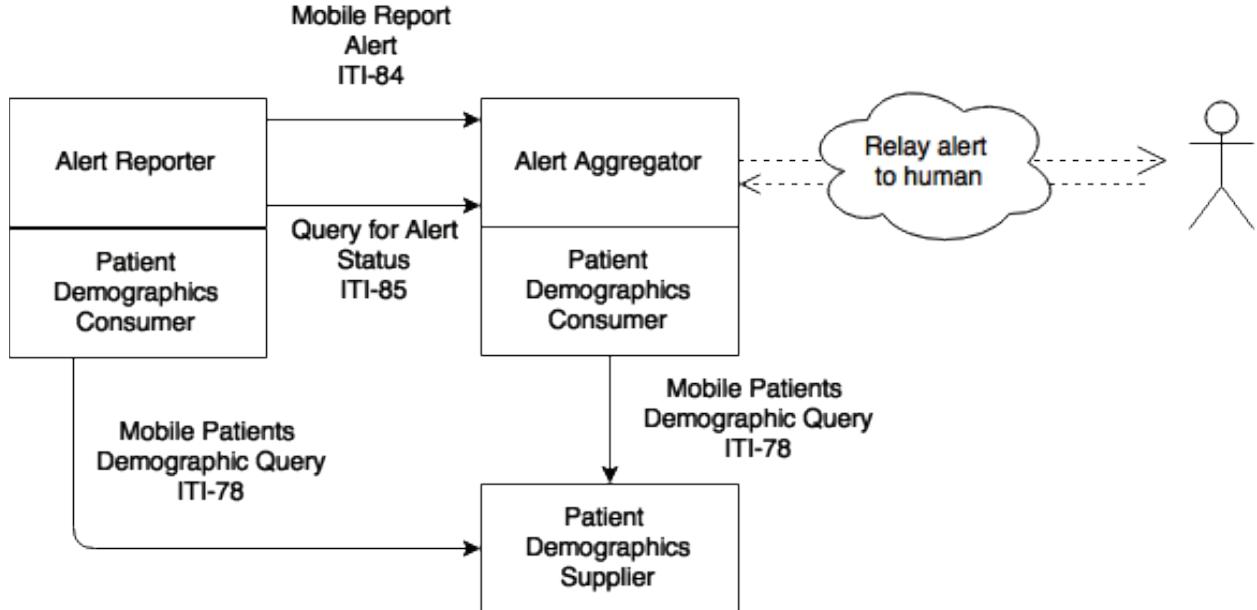

Figure 42.6.2-1: mACM Actor Interactions with a Client Registry using the PDQm Profile

In Figure 42.6.2-2, the PDQm Patient Demographics Supplier acts as a registry of subjects of care in the health system. The Alert Reporter, grouped with a Patient Demographics Consumer, executes an appropriate Mobile Patients Demographic Query [ITI-78] transaction to determine a list of enterprise IDs for targeted subjects of care according to internal business requirements. The Alert Reporter then sends the alert on to the Alert Aggregator using the Mobile Report Alert [ITI-84] transaction. The Alert Aggregator, grouped with a Patient Demographics Consumer, may also execute an appropriate Mobile Patients Demographic Query [ITI-78] transaction in order to determine the contact points (e.g., cell phone number) of the referenced subject of care.
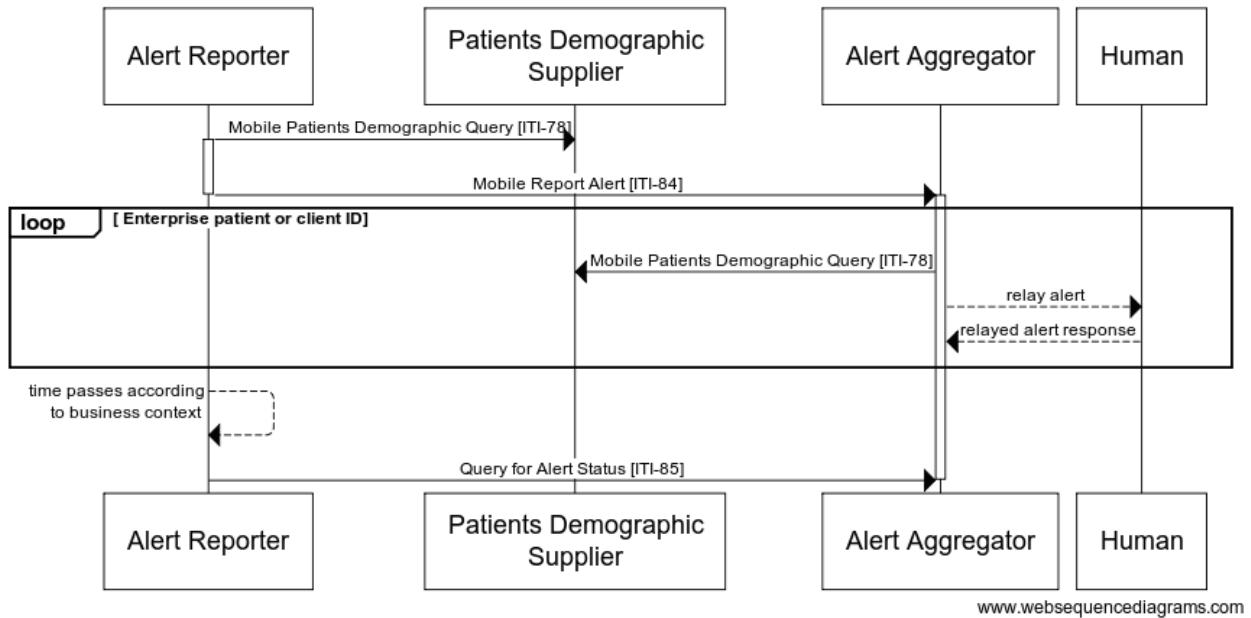

Figure 42.6.2-2: Sequencing of mACM Actor Interactions with a Client Registry

The text in Figure 42.6.2.2-3 was used to generate the diagram in Figure 42.6.2.2-2. Readers will
615   generally find the diagram more informative. The text is included here to facilitate editing.

```

**Figure 42.6.2-3: Pseudocode for Sequencing of mACM Actor Interactions
with a Client Registry**

640   In Figure 42.6.2-2, a potential sequencing of the transactions in Figure 42.6.2-1 is illustrated.
      These steps may be described as follows:

1. The Alert Reporter, grouped with a Patient Demographics Consumer, executes the
    Mobile Patient Demographics Query [ITI-78] transaction against a Patient Demographics
    Supplier to determine the enterprise IDs for a list of Subjects of Care matching a set of
645 criteria. The specific criteria used are dependent on the business context under which the
    alert is intended to be communicated.

2. Using the resultant list of Subject of Care enterprise IDs, the Alert Report executes
    Mobile Report Alert [ITI-84] to report the given alert to an Alert Aggregator.

3. For each Subject of Care identified in the alert, the Alert Aggregator, grouped with a
650 Patient Demographics Consumer, determines available contact points (e.g., telephone
    number, email address) by executing Mobile Patient Demographics Query [ITI-78]
    against a Patient Demographics Supplier.

Volume 2 – Transactions

3.84 Mobile Report Alert [ITI-84]

3.84.1 Scope

655

The Mobile Report Alert transaction is used to issue alerts to health workers and subjects of care.

An Alert Reporter initiates a Mobile Report Alert transaction against an Alert Aggregator.

3.84.2 Actor Roles
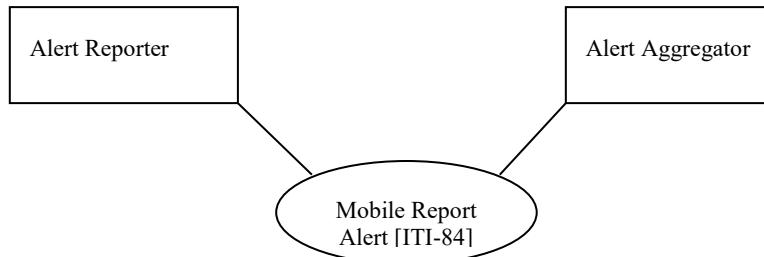

660

Figure 3.84.2-1: Use Case Diagram

Table 3.84.2-1: Actor Roles

Actor:	Alert Reporter
Role:	Sends an alert to an Alert Aggregator for dissemination to a health worker or subject of care.
Actor:	Alert Aggregator
Role:	Accepts an alert from an Alert Reporter for dissemination to subjects of care and health workers

3.84.4 Interaction Diagram

The following interaction diagram illustrates an Alert Reporter sending a Mobile Report Alert to
675 an Alert Aggregator via the message semantics as defined for a `CommunicationRequest`
resource.
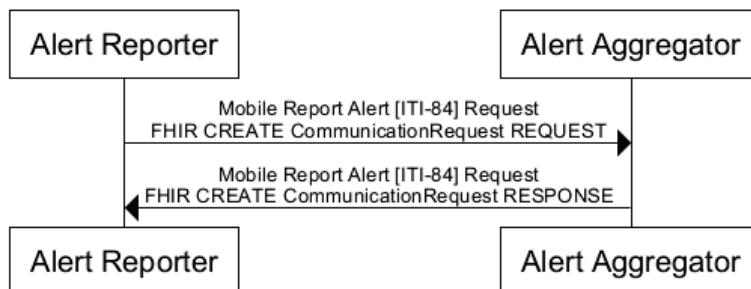

Figure 3.84.4-1: Interaction Diagram

680 The text in Figure 3.84.4-2 was used to generate the diagram in Figure 3.84.4-1. Readers will
generally find the diagram more informative. The text is included here to facilitate editing.

```
title

Alert Reporter->Alert Aggregator: \nMobile Report Alert [ITI-84] Request\nFHIR CREATE
CommunicationRequest REQUEST

Alert Aggregator->Alert Reporter: \nMobile Report Alert [ITI-84] Request\nFHIR CREATE
CommunicationRequest RESPONSE
```

690 **Figure 3.84.4-2: Pseudocode for Interaction Diagram**

3.84.4.1 Mobile Report Alert Request

The Alert Aggregator shall support the message semantics for create as defined at
http://hl7.org/fhir/STU3/http.html#create as applicable to a `CommunicationRequest` Resource
defined at http://hl7.org/fhir/STU3/communicationrequest.html.

695 The `CommunicationRequest` Resource is further constrained as defined in Section 3.84.4.1.2.1.

3.84.4.1.1 Trigger Events

An Alert Reporter triggers a Mobile Report Alert Request according to the business rules for the
alert being issued. These business rules are out of scope of this transaction.

3.84.4.1.2 Message Semantics

700 An Alert Reporter initiates a create request as defined at
http://hl7.org/fhir/STU3/http.html#create on the `CommunicationRequest` Resource in order to
report a new alert.

An Alert Reporter shall use either the XML or the JSON messaging formats as defined in FHIR.
An Alert Aggregator shall support receiving a request in both the JSON and the XML messaging
705 formats as defined in FHIR. See ITI TF-2x: Appendix Z.6 for more details.

3.84.4.1.2.1 FHIR CommunicationRequest Resource Constraints

An Alert Aggregator and an Alert Reporter shall use a FHIR `CommunicationRequest` Resource.
The FHIR `CommunicationRequest` Resource shall be further constrained as described in Table
3.84.4.1.2.1-1. The Data Field column in Table 3.84.4.1.2.1-1 references the object model
710 defined at http://hl7.org/fhir/STU3/communicationrequest.html.

Table 3.84.4.1.2.1-1: `CommunicationRequest` Resource Constraints

Data Field & Cardinality	Description & Constraints	FHIR Data Type
category [1..*]	Signifies that this communication shall be disseminated by the Alert Aggregator according to the expected actions defined in Section 3.84.4.1.3. One of the entries of this data field shall contain: - The `coding.code` attribute value is defined in the "Code" column of Table 3.84.5.1-1 - The value `coding.system` attribute value shall be "1.3.6.1.4.1.19376.1.2.5.1"	CodeableConcept

---

Data Field & Cardinality	Description & Constraints	FHIR Data Type
payload [1..*]	This data field contains the content of the alert. Note that this cardinality differs from the cardinality required in the FHIR `CommunicationRequest` Resource. The Alert Aggregator shall include at least one payload element with the unstructured text content of the alert. Additional payload elements may be present, for example for compliance with jurisdictional accessibility requirements, literacy issues, or translations of the unstructured text content in other languages. The `payload` element shall have at least one `contentAttachment` element that meets the following requirements: • The payload shall contain the language of the unstructured plain text content in the `contentAttachment.language` attribute • The payload shall contain the unstructured plain text content of the alert to be communicated in the `contentAttachment.title` attribute • The payload shall have the value "text/plain" in the `contentAttachment.content-type` attribute	`Attachment`
priority [1..1]	• The value for priority shall be taken from FHIR code system RequestPriority. See http://hl7.org/fhir/codesystem-request-priority.html.	`code`

3.84.4.1.2.1.1 FHIR CommunicationRequest Resource Constraints – Disseminate and Report Alert Status Option

715   For Alert Reporter and Alert Aggregator Actors that support the Disseminate and Report Alert Status Option, the additional constraints in Table 3.84.4.1.2.1-1 apply to the `CommunicationRequest` Resource.

**Table 3.84.4.1.2.1.1-1: Additional Resource Constraints For the Disseminate and Report
Alert Status Option**

Data Field & Cardinality	Description & Constraints	FHIR Data Type
reasonCode [0..*]	This data field identifies secondary characteristics of the alert. • The coding.code attribute value is defined in the "Code" column of Table 3.84.5.1-3, as appropriate to the business context • The value coding.system attribute value is defined in the "Code System" column of Table 3.84.5.1-3	CodeableConcept

720

3.84.4.1.3 Expected Actions

The Alert Aggregator shall issue a Mobile Report Alert Response upon validation of a received
Mobile Report Alert Request. See Section 3.84.4.2.

725 The Alert Aggregator shall respond with appropriate HTTP error codes as described at
http://hl7.org/fhir/STU3/http.html#create if any of the following conditions are met:

- Return 400 if the Mobile Report Alert Request was invalid

- Return 422 with an OperationOutcome Resource if the alert
  CommunicationRequest.category.code has value "pcd-alert" and the Alert Aggregator
  does not support the Disseminate and Report Alert Status Option

730 If the Mobile Alert Request is valid, the Alert Aggregator shall create a CommunicationRequest
Resource as described at http://hl7.org/fhir/STU3/communicationrequest.html and constrained in
Section 3.84.4.1.2.1.

The Alert Aggregator shall create a Communication Resource as described at
http://hl7.org/fhir/STU3/communication.html and constrained in Section 3.84.4.1.3.1 for each
735 alert that it sends.

For each alert response received, the Alert Aggregator shall create a Communication Resource as
constrained in Section 3.84.4.1.3.1 and update the CommunicationRequest.status field
according to the translation tables in Section 3.84.5.2.

The jurisdiction should determine the retention policy for response status events.

740 Figure 3.84.4.1.3-1 shows the sequencing of the FHIR Resource creation.
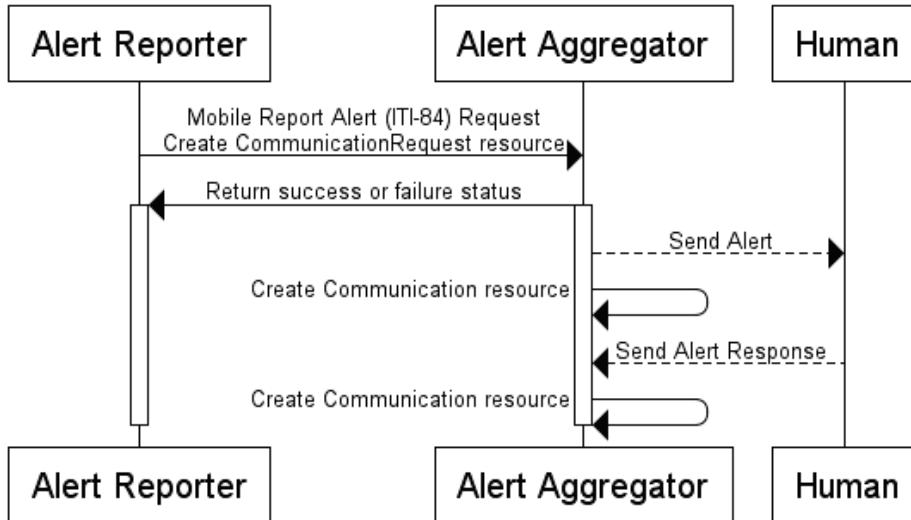

Figure 3.84.4.1.3-1: Process flow diagram for FHIR Resource creation

The text in Figure 3.84.4.1.3-2 was used to generate the diagram in Figure 3.84.4.1.3-1. Readers will generally find the diagram more informative. The text is included here to facilitate editing.

deactivate Alert Aggregator
```

Figure 3.84.4.1.3-2: Pseudocode for Process flow diagram for FHIR Resource creation

770 **3.84.4.1.3.1 FHIR Communication Constraints**

The FHIR `Communication` Resource shall be constrained as described in Table 3.84.4.1.3.1-1.

Table 3.84.4.1.3.1-1: `Communication` Resource Constraints

Data Field & Cardinality	Description & Constraints	FHIR Data Type
`_lastUpdated` `[1..1]`	The last time that the `Communication` Resource was updated or an associated alert dissemination status was updated.	`instant`
`basedOn` `[1..1]`	A reference to the CommunicationRequest Resource that triggered the creation of this Communication Resource.	`Reference (CommunicationRequest)`
`reasonCode` `[0..*]`	This data field identifies secondary characteristics of the alert. In the case of an Alert Aggregator which is exercising the Disseminate and Report Alert Status Option, the `CodeableConcept` shall further be constrained so that: • The `coding.code` attribute value is defined in the "Code" column of Table 3.84.5.1-3, as appropriate to the business context • The value `coding.system` attribute value is defined in the "Code System" column of Table 3.84.5.1-3	`CodeableConcept`

3.84.4.1.3.2 Expected Actions – Disseminate and Report Alert Status Option

775 Under the Disseminate and Report Alert Status Option, if the Mobile Report Alert Request
contains a value of "pcd-alert" in `CommunicationRequest.category.code` then the Alert
Aggregator grouped with the ACM Alert Manager shall disseminate the alert to designated
recipients using the Disseminate Alert [PCD-06] transaction. The grouped actor shall record
dissemination status updates related to the dissemination of the alert according to the translation
780 tables in Section 3.84.5.2. Additional constraints on the `CommunicationRequest.category` and
`CommunicationRequest.reasonCode` data fields are defined in Table 3.84.5.1-1 and Table
3.84.5.1-3 respectively.

For each valid Report Dissemination Alert Status [PCD-07] request the Alert Aggregator
receives, it shall create a `Communication` Resource as described in Section 3.84.4.1.3.1 and
785 update the `CommunicationRequest.status` field according to the translation tables in Section
3.84.5.2.

Figure 3.84.4.1.3.2-2 shows the sequencing of the transactions for the Disseminate and Report
Alert Status Option.
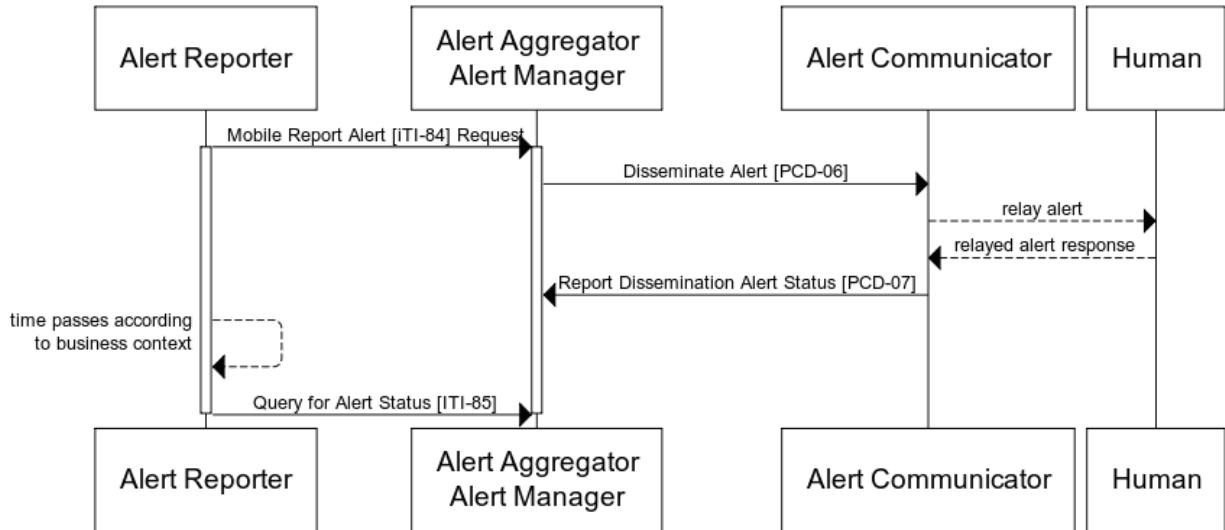

790

3.84.4.2 Mobile Report Alert Response

825   The Mobile Report Alert transaction uses the response semantics as appropriate according to the FHIR operation initiated by the Alert Reporter.

3.84.4.2.1 Trigger Events

An Alert Aggregator sends a Mobile Report Alert Response to the Alert Reporter upon validation of a received Mobile Report Alert Request.

830   ### 3.84.4.2.2 Message Semantics

The Alert Aggregator shall respond with the appropriate response codes as defined at http://hl7.org/fhir/STU3/http.html#create.

3.84.4.2.3 Expected Actions

There are no additional actions required on the Alert Reporter upon receipt of the Mobile Report
835   Alert Response.

If an Alert Reporter does not receive a valid Mobile Report Alert Response, it may reinitiate the transaction.

3.84.5 Alert Terminologies and Mappings

This section contains tables of terminologies referenced as well as mappings between referenced
840   terminologies for the Mobile Report Alert [ITI-84] transaction.

3.84.5.1 Defined Terminologies

This section contains tables of terminologies referenced in the Mobile Report Alert [ITI-84] transaction.

The following table contains values, which shall be used by the Alert Reporter in the Mobile
845   Alert Request message for `CommunicationRequest.category`.

Table 3.84.5.1-1: Mobile Report Alert Category Code System - 1.3.6.1.4.1.19376.1.2.5.1

Code	Meaning
alert	Signifies that this communication is intended to be disseminated by the Alert Aggregator according to the expected actions defined in Section 3.84.4.1.3.
pcd-alert	Signifies that this communication is intended to be disseminated by the Alert Aggregator according to the expected actions defined in Section 3.84.4.1.3 and disseminated according to the Disseminate and Report Alert Status Option. For example, when the Alert Reporter wants the message disseminated by the in-house PCD system rather than the general contact method.

The following table contains values which shall be used by the Alert Reporter in the Mobile
Alert Request message for `CommunicationRequest.reasonCode`. These are secondary
850   characteristics that apply to an alert that is intended for dissemination under the Disseminate and
Report Alert Status Option.

Table 3.84.5.1-3: Mobile Report Characteristics Value Set OID - 1.3.6.1.4.1.19376.1.2.5.3

Codes	Code System	List of codes
All Codes from	`1.3.6.1.4.1.19376.1.2.5.3.1`	
All Codes from	`1.3.6.1.4.1.19376.1.2.5.3.2`

SA	1.3.6.1.4.1.19376.1.2.5.3.3	Alert Source: alarm – advisory
SP	1.3.6.1.4.1.19376.1.2.5.3.3	Alert Source: alarm – physiological
alarm-paused	1.3.6.1.4.1.19376.1.2.5.3.4	Inactivation State: Alarm is paused
alarm-off	1.3.6.1.4.1.19376.1.2.5.3.4	Inactivation State: Alarm is off
audio-paused	1.3.6.1.4.1.19376.1.2.5.3.4	Inactivation State: Audio is paused
audio-off	1.3.6.1.4.1.19376.1.2.5.3.4	Inactivation State: Audio is off
inactive	1.3.6.1.4.1.19376.1.2.5.3.5	Alert State: inactive
active	1.3.6.1.4.1.19376.1.2.5.3.5	Alert State: active
latched	1.3.6.1.4.1.19376.1.2.5.3.5	Alert State: latched

3.84.5.2 Mappings Between Terminologies

860   This section contains mappings of terminologies referenced in the Mobile Report Alert [ITI-84]
transaction for use in the Disseminate and Report Alert Status Option. The translation tables
provide a mapping from the FHIR CommunicationRequest Resource to the data fields in the
Disseminate Alert [PCD-06] and Report Dissemination Alert Status [PCD-07] transactions.

Table 3.84.5.2-1: Disseminate Alert Field Translation

PCD-06 Data Field	CommunicationRequest Resource Data Field	Comments
Alert_Location	CommunicationRequest.sender(Device).location	Examples in PCD-06 refer to Devices. If sender refers to a Device Resource, then you can get the Location from that.
Alert_Patient	CommunicationRequest.subject	
Alert_Identifier	CommunicationRequest._id	
Alert_Callback		Not mapped

PCD-06 Data Field	CommunicationRequest Resource Data Field	Comments
Alert_Reference	URL of CommunicationRequest Resource	
Alert_Comment	CommunicationRequest.payload.contentAttachment.title	The appropriate choice of language of the contentAttachment should be made if more than one is provided
Alert_Evidentiary_Data		Not mapped

Table 3.84.5.2-2: Disseminate Alert Status Field Translation

PCD-06 Data Field	Communication or CommunicationRequest Resource Data Field	Comments
Alert_Identifier	CommunicationRequest._id	
Alert_Status	CommunicationRequest.status and Communication.status	The value in the FHIR RequestStatus or EventStatus value set shall be encoded according to Table 3.84.5.2-3
	Communication.reasonCode	This value shall be encoded according to Table 3.84.5.1-3

865

Table 3.84.5.2-3 contains the mapping from the Alert_Status codes used in the Report Dissemination Alert Status [PCD-07] transaction to the RequestStatus value set defined at http://hl7.org/fhir/STU3/codesystem-request-status.html.

Table 3.84.5.2-3: Alert Status Value Set Mapping

Alert_Status code from [PCD-07]	Code from FHIR RequestStatus value set	Code from FHIR EventStatus value set
Received	active	in-progress
Undeliverable	cancelled	aborted
Delivered	active	in-progress
Read	completed	completed
Accepted	completed	completed
AcceptedPositive	completed	completed
AcceptedNotRelevant	completed	completed
AcceptedFalse	completed	completed
Rejected	cancelled	aborted
Cancelled	cancelled	aborted

Alert_Status code from [PCD-07]	Code from FHIR RequestStatus value set	Code from FHIR EventStatus value set
CancelledOther	cancelled	aborted
CallBackStart	active	in-progress
CallBackEnd	active	in-progress

870

Table 3.84.5.2-4 contains a mapping from the facets for the Report Alert [PCD-04], Disseminate
Alert [PCD-06], and Disseminate Alert Status Report [PCD-07] transactions to the FHIR
`CommunicationRequest` Resource data fields as extended by this transaction.

Table 3.84.5.2-4: Disseminate Alert Facet Translation

PCD-04, PCD-06 and PCD-07 Facet	`CommunicationRequest` Resource Data Field	Comments
Event identification	`CommunicationRequest._id`	
Source identification	`CommunicationRequest.sender._id`	Applicable only in the case that the sender was a device
Event phase	`CommunicationRequest.reasonCode` for the code system `1.3.6.1.4.1.19376.1.2.5.3.2`	
Alert state	`CommunicationRequest.reasonCode` for the code system `1.3.6.1.4.1.19376.1.2.5.3.5`	
Inactivation state	`CommunicationRequest.reasonCode` for the code system `1.3.6.1.4.1.19376.1.2.5.3.4`	
Alarm priority	`CommunicationRequest.priority.code`	
Alert type	`CommunicationRequest.reasonCode` for the code system `1.3.6.1.4.1.19376.1.2.5.3.3`	

875 The following table contains a mapping which shall be used by the Alert Reporter in the Mobile
Alert Request message for `CommunicationRequest.priority`. This table is adapted from PCD
TF-2: Table 8-4 and maps to the RequestPriority value set at http://hl7.org/fhir/request-priority.

Table 3.84.5.2-5: Mobile Report Alert Priority Code System

Code	Code from RequestPriority value set	Comments
PN	routine	Since this field is required, there is no option to not have a priority, so default to routine.
PL	urgent	
PM	asap	

Code	Code from RequestPriority value set	Comments
PH	stat	

3.84.6 Security Considerations

See ITI TF-2x: Appendix Z.8 for common mobile security considerations.

3.85 Query for Alert Status [ITI-85]

3.85.1 Scope

This transaction is used by an Alert Reporter to determine from the Alert Aggregator the status
and any acknowledgements of one or more alerts by the recipient.

3.85.2 Actor Roles
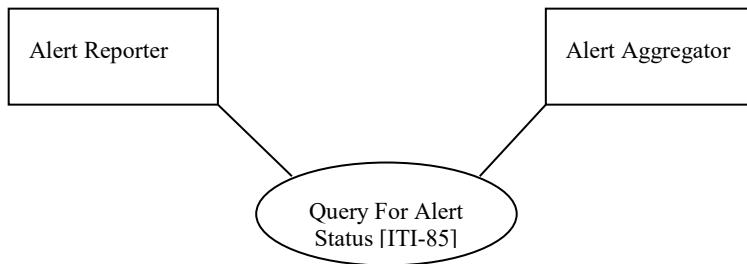

Figure 3.85.2-1: Use Case Diagram

Table 3.85.2-1: Actor Roles

Actor:	Alert Reporter
Role:	Queries an Alert Aggregator for the status of one or more alerts that it issued.
Actor:	Alert Aggregator
Role:	Sends any status messages and human recipient acknowledgments for the indicated alerts

915   **3.85.4.1 Query for Alert Status Request Message**

The Query for Alert Status Request message is a FHIR search operation on the `CommunicationRequest` and `Communication` Resources.

3.85.4.1.1 Trigger Events

An Alert Reporter triggers a Query for Alert Status Request to an Alert Aggregator according to the business rules for the alert(s) being investigated. These business rules are out of scope of this profile.

3.85.4.1.2 Message Semantics

An Alert Reporter initiates a search request using HTTP GET as defined at http://hl7.org/fhir/STU3/http.html#search on the `CommunicationRequest` Resource or the `Communication` Resource.

An Alert Aggregator shall support combinations of search parameters as defined at http://hl7.org/fhir/STU3/search.html#combining, "Composite Search Parameters."

The Alert Aggregator shall support all search parameters at http://hl7.org/fhir/STU3/communicationrequest.html#search and http://hl7.org/fhir/STU3/communication.html#search.An Alert Aggregator shall support receiving a request for both the JSON and the XML messaging formats as defined in FHIR. An Alert Reporter shall use either the XML or the JSON messaging formats as defined in FHIR. See ITI TF-2x: Appendix Z.6 for more details.

3.85.4.1.3 Expected Actions

The Alert Aggregator shall return matching `Communication` or `CommunicationRequest` Resources in a Query for Alert Status.

3.85.4.2 Query for Alert Status Response Message

The Query for Alert Status [ITI-85] transaction uses the response semantics as defined at http://hl7.org/fhir/STU3/http.html#search as applicable for the `CommunicationRequest` Resource, as defined at http://hl7.org/fhir/STU3/communicationrequest.html, or the `Communication` Resource, as defined at http://hl7.org/fhir/STU3/communication.html.

3.85.4.2.1 Trigger Events

The Alert Aggregator sends the Query for Alert Status Response to the Alert Reporter upon when results to the query are ready.

3.85.4.2.2 Message Semantics

The Alert Aggregator shall support the search response message as defined at http://hl7.org/fhir/STU3/http.html#search on the `CommunicationRequest` Resource, defined at http://hl7.org/fhir/STU3/communicationrequest.html or the `Communication` Resource, defined at http://hl7.org/fhir/STU3/communication.html.

950 ### 3.85.4.2.3 Expected Actions

This behavior is not further defined or constrained by IHE.

3.85.5 Alert Terminologies and Mappings

The alert terminologies and their mappings are described in Section 3.84.5.

3.85.6 Security Considerations

955 See ITI TF-2x: Appendix Z.8 for common mobile security considerations.

Volume 2 Namespace Additions

Add the following terms to the IHE General Introduction Appendix G:

The mACM Profile defines following OIDs:

- 1.3.6.1.4.1.19376.1.2.5 the root OID for the mACM Profile

960
- 1.3.6.1.4.1.19376.1.2.5.1 the OID for the code set used by mACM for specifying the category of a FHIR `CommunicationRequest` or `Communication` Resource

- 1.3.6.1.4.1.19376.1.2.5.3 the OID for the value set used by mACM for specifying the reasonCode of a FHIR `CommunicationRequest` or `Communication` Resource

- 1.3.6.1.4.1.19376.1.2.5.3.1 the OID for the code set used by mACM for PCD abnormal
965 type

- 1.3.6.1.4.1.19376.1.2.5.3.2 the OID for the code set used by mACM for PCD event phase

- 1.3.6.1.4.1.19376.1.2.5.3.3 the OID for the code set used by mACM for PC alert type

- 1.3.6.1.4.1.19376.1.2.5.3.4 the OID for the code set used by mACM for PCD inactivation state

970
- 1.3.6.1.4.1.19376.1.2.5.3.5 the OID for the code set used by mACM for PCD alert state
